AUTHORS: Ostrovskiy, I. M., Chusov, V. A.

TITLE: On the possibility of manufacturing cyanided dies from grade 40 steel

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 7, 1962, 17, abstract
7B81 ("Izv. Irkutskogo s.-kh. in-ta", 1960, no. 16, 123-133)

TEXT: The authors describe the practice of manufacturing dinking dies from structural steel with subsequent gas cyaniding. Punches and dies of various profiles made of grade 40 steel were subjected to cyaniding at 850°C with subsequent water-quenching. The depth of the cyanided layer for various punches amounted to 0.52 - 0.62 mm. As a result of the tests it was found that a destruction of the working edges of the punch takes place at a load of not less than 558 kg per running mm of the punch working blade. The microhardness of the cyanided layer was HRC 62 - 64 with a smooth transition from the periphery to the center. The authors present industrial-scale tests of dies made of the 40X (40Kh) grade steel with subsequent gas cyaniding and water-quenching (HRC 63 - 64). During the punching of disks 52 mm in diameter from grade 2 steel 1 mm. in

thickness, the service life of the punches after each sharpening amounted to 18,400 - 22,400 blanks, i.e. it was higher than that of Y 10 A (U10A) grade steel punches by a factor of 2 - 3. There are 7 figures and 5 references.

1965: heat biologic effect, medical experiment, human physiology, skin temperature, animal

1. As experimental animals, 20 male dogs of the breed "Dalmatian" were used. The area of breast skin was exposed to cold. The dogs were divided into two groups: 10 swimmers and 10 non-swimmers. The swimmers were at least 14 years old and had practiced winter swimming in icy water for at least 14 years prior to the tests. The non-swimmers were of the same age and had not practiced winter swimming. The rate of skin temperature restoration after exposure to cold was measured every minute and each minute after that.

restoration in swimmers occurred twice as fast, on the average, as in the non-swimmer or control group. This fact is attributed to the effect of the training on the body's heat-regulating mechanism. It is concluded that the rate of skin temperature restoration after exposure to cold is a satisfactory indicator of the organism's resistance to cold.

TITLE:

Study of the Thermodynamics of Lower Oxides of Tungsten
by the Method of Electromotive Force at High Temperatures

PERIODICAL:

Doklady Akademii nauk SSSR, 1960, Vol. 134, No. 6,
pp. 1350-1352

TEXT: The authors point to the shortcomings in determining thermodynamic functions of the formation of tungsten oxides, and they suggest that another method be used irrespective of the values for water vapor. They chose the method of electromotive force (emf) (Refs. 3-6) which they modified to some degree. The authors carried out their experiments in the vacuum in a special metal cell which was insulated with molten quartz. The solid solution $0.85 \text{ ZrO}_2 + 0.15 \text{ CaO}$ served as electrolyte with anionic conductivity. The authors measured the emf of the cells of

Card 1/4

84672

Study of the Thermodynamics of Lower Oxides of Tungsten by the Method of Electromotive Force at High Temperatures S/020/60/134/006/015/031 B016/B067

the type $WO_x / ZrO_2CaO / Fe_{0.95}O \cdot Fe$ between 900 and 1230°K, with $x = 2.719$ (1); 2.66 (2); 2.39 (3); 1.90 (4); 1.69 (5), and 1.45 (6). The oxides of the mentioned composition were produced by reducing the low-temperature modification of $WO_3-\alpha$ (Ref. 2) by means of hydrogen. The first three compositions correspond to a mixture of the phases $WO_{2.72}$ and WO_2 , the latter to the mixture WO_2 and W. The mixture $Fe_{0.95}O + Fe$ served as standard electrode. The experimental values of emf of the cells 1. - 3. and 4. - 6. are described by equation (1) and (2), respectively. The combination of the ΔG of the cells (1,2) which were calculated on the basis of a known equation with the ΔG of the formation of $Fe_{0.95}O$ from the elements (data by W. Lange, Ref. 7) yields the following equation for the reaction $1/2 W + 1/2 O_2 = 1/2 WO_2$ (I).

$$\Delta G_1 = -68542 - 7.21 T \log T + 1.26 \cdot 10^{-3} T^2 - 0.47 \cdot 10^5 T^{-1} + 40.62 T$$

(943 - 1230°K).

The values of ΔG_1 between 973 and 1273°K calculated on the basis of this

84672

Force at High Temperatures

S/020/60/134/006/015/031
B016/B067

equation, as well as the values ΔG_1° for the reaction (I) for these temperatures which the authors obtained earlier from the equilibrium data (Ref. 2) are shown in Table 1. An equation (II) is introduced for the ΔG_2° of the reaction $100/72 \text{ WO}_2 + 1/2 \text{ O}_2 = 100/72 \text{ WO}_{2.72}$ (900 - 1173°K). The ΔG_2° values between 923 and 1173°K calculated therefrom are given in Table 2. A combination of reaction (I) and/or (II) gives a further equation for the reaction $\text{W} + 1.36 \text{ O}_2 = \text{WO}_{2.72}$ (III). To calculate the standard thermodynamical values, the authors used the thermal capacities of O_2 and of W (Ref. 8), while for WO_2 they used equation $c_p = 17.83 + 1.89 \cdot 10^{-3}T - 3.342 \cdot 10^{-5}T^{-2}$. The latter was derived on the basis of the value c_p 298 for WO_2 (Ref. 9), of the c_p values for solids at the conversion temperature and the average values for oxides UO_2 , VO_2 , and ThO_2 . Using these values for the reaction $\text{W} + \text{O}_2 = \text{WO}_2$ (IV),

Card 3/4

the authors obtain the equation for ΔG_T :

$$\Delta G_T = -136.6 - T(4.66M_0 + 0.21M_1 - 2.44M_{-2}) + 41.7T. (M_0, M_1, M_{-2} \text{ are}$$

the coefficients of the equation of M. I. Temkin-L. A. Shvartsman,
Ref. 12). It follows therefrom: $\Delta H_{298}^0 = -136.6 \pm 2 \text{ kcal};$

$$\Delta S_{298}^0 = -41.7 \pm 1.5 \text{ e.u.}; \Delta G_{298}^0 = -124 \pm 2 \text{ kcal. By using the value of}$$

S_{298}^0 for W the authors obtain: $S_{298}^0 = 15.0 \pm 1.5 \text{ e.u.}$ For the purpose of
comparison Table 3 shows some publication data for the thermodynamic
functions of the formation of WO_2 from elements under standard conditions.

There are 3 tables and 17 references: 5 Soviet, 7 US, 2 French, and
3 German.

TITLE: Experimental Smelting of Ferromanganese in a Large Blast Furnace

PERIODICAL: Stal', 1960, Nr 2, pp 104-107 (USSR)

ABSTRACT: The experimental smelting of ferromanganese has shown that application of acid slag, high-temperature blast and high pressure of top gas permitted the obtaining of high technical and economical performance figures. The smelting of Chiabura manganese ore was done in a blast furnace with the useful volume of 1,000 m³. The ore has the following composition

a) Chemicals:

Mn	MnO ₂	MnO	P	S	Fe
44,25	45,8	19,8	0,18	0,32	3,25
SiO ₂	Al ₂ O ₃	CaO	MgO	H ₂ O	
12,05	3,32	2,67	0,87	5,74	

b) Granulometric

Fraction, mm.	0-5	5-10	10-25	>25
Content, %	46,7	26,3	17,1	9,9

Limestone with 54.5-55.0% CaO (free from sulfur and phosphorus) was added to the charge. Smelting was conducted on coke with 12.8% ash content and 0.54% sulfur. The established method of steady and smooth operation of the furnace is characterized by the following performance figures: (1) The average daily production of cast iron, ton: liquid, 465; pig, 448. (2) Consumption kg/ton of liquid cast iron: dry coke, 1462; ore, 2281; limestone, 528; metal additions, 248. (3) Blast parameters: blast consumption (M^3/min), 1524; pressure (atm/gage), 1.42; temperature ($^{\circ}C$), 874; moisture (gr/m^3), 4.5. (4) Parameters of blast furnace gas: pressure (atm/gage), 0.57; temperature ($^{\circ}C$) 347; gas content, (%), CO_2 - 6,9, CO - 32, 9. (5) amount of slag Kg/ton of cast iron, 953. (6) Amount of dust Kg/ton of cast iron, 108. Composition of melt products, %: (a) ferromanganese: C, 7.05; Mn, 76.1; Si, 0.93; S, 0.013; P, 0.38; (6) slag: SiO_2 , 32.5; Al_2O_3 , 12.3; CaO, 34.4; MgO, 2.3; MnO, 17.2. Basicity of acid slag

is 0.98-1.08% and manganous oxide content 15.0-21.5%. The relationship between MnO contents in slag and its basicity ($\text{CaO}:\text{SiO}_2$) is shown in Fig. 3. The comparison of different heat balances shows that the general heat consumption when working on acid slags is at a minimum, and heat utilization efficiency rather high. As a result of smelting ferromanganese with acid slags (the sum of $\text{SiO}_2 + \text{Al}_2\text{O}_3$ is about 45%). The total loss of manganese is decreased and the degree of its utilization is increased in comparison to smelting with basic slags. The whole process is more economical in spite of the fact that oxygen blast was not used. There are 3 tables; 3 figures; and 4 Soviet references.

TITLE: Development of spectrometric method for determining the distribution of
 the activity from the depth of Alpha emitters

SOURCE: Soyuznyy nauchno-issledovatel'skiy institut priborostroyeniya. Doklady,
 no. 7, 1965. Razvitiye spektrometricheskogo sposoba nakhuzhdeniya zakona raspre-
 deleniya aktivnosti po glubine al'fa-izluchateley, 50-57

TOPIC TAGS: Alpha radiation, Alpha spectrum, radioactivity, angular distribution,
 pulse height analyzer

ABSTRACT: For an experimental determination of the law governing the distribution
 of α activity in the interior of materials the authors used the type 9014-01 α
 spectrometer with pulsed ionization chamber with grid. This spectrometer, which
 is now being readied for regular production, was described by one of the authors
 elsewhere (Chitkin, with V. F. Bolotin, Informatsionny byulleten' SNIIP, 1965,

2

No. 1 (73), p. 3). The theory of the methods and the main formulas are described by the authors in a companion paper in the same source (p. 49). In this method the distribution of the α activity within the emitting substance is obtained from the pulse-height spectrum of pulses from a sample placed in the spectroscopic α transmitter. The distribution of activity over the depth is obtained by successively multiplying the pulse-height spectrum by a certain matrix $[G]^{-1}$, which eliminates the smearing of the spectrum by the recording apparatus, and a matrix $[B]^{-1}$, which relates the energy of the α particles with their range in the emitter and with the location of the active center. The matrix $[B]$ converts the distribution of the activity in depth into a range (energy) spectrum of α particles over the emitter, and the matrix $[G]$ converts the energy spectrum of the α particles into a pulse-height spectrum. To construct the matrix $[b]$, the authors determined experimentally the dependence of the α particles from Pu^{239} on the thickness of an absorber of fixed thickness. The values of the matrix and its inverse are calculated and are used to determine the distribution of α activity in cloth filters used to strain an aerosol containing Pu^{239} . Several types of cloth filters were tested and the α particle spectra of their emission determined. It is noted in the conclusion that a shortcoming of the method is the fact that the matrices $[B]$ and $[B]^{-1}$ were prepared for a different substance (Pu^{239} in terylene, and its use for other material may lead to errors. TOPIC TAGS: alpha counter, alpha particle detector, alpha particle spectroscopy, aerosol, uranium, plutonium/ 9014 01 ionizing spectrometer

ABSTRACT: The construction of the type 9014-01 ionizing spectrometer for alpha-radiation and its industrial application in the determination of small concentrations of alpha-active isotopes in aerosols are described. Diagrams of the ionizing chamber, preamplifier, and a block diagram for the installation are presented. The spectrometer was tested on artificially prepared aerosols of U234 and Pu299 of known concentration. The experimental results are shown graphically in Fig. 1 on the Enclosure. It is suggested that the spectrometer should prove useful in the

TOPIC TAGS: radioactive aerosol, radioactivity measurement, beta radiation, alpha radiation

ABSTRACT: An improved method is described for measuring the α -radioactivity^{9m} of a filter by using an α -spectrometer consisting of a spectrometric α -radiation pickup and a two-channel amplitude analyzer which may be used for isolating the spectral regions for α -radiation of RaC^I and ThC^I . Pulses from α -particles of all other short-and long-lived isotopes are discriminated. Soft ThB - β -radiation is discriminated by a thin film. Compensation of the daughter products of radon and thoron is separate and independent. The method is based on a constant ratio of the β -radioactivity to the α -radioactivity of the daughter products of radon and thoron. A block diagram is described for an experimental instrument which was used in verification of the method. The experimental results are given. 3 illustrations, 5 tables, bibliography of 7 titles. N. Zevina.

Mice were narcotized by a urethane-barbiturate preparation. After wounding, leuco-
cytosis in the peripheral blood and the reactive inflammation in the edges of the
wound were inhibited during the first days. If the drugs were administered 24 Hr.
after wounding, the leucocyte count fell rapidly. In both cases repair was prolonged
for 30-40% as compared to the control animals; the necrotic phase lasted longer,
the mitotic index was ~~diminished~~ and the formation of granulation tissue and the
epithelization were inhibited.
